

Quickly identify and resolve application and network readiness issues...

Liquidware Labs Stratusphere™ gives you a new level of visibility into user and application activity and provides visibility to all parts of the virtual desktop infrastructure (VDI) from the terminal to back-end servers to the SAN.

### VDI Network and Application Assessments

Stratusphere uses patented Connector ID™ technology to identify and track thin clients, desktops, applications and users. Our Stratusphere virtual machine installs in the virtual network layer, exposing all protocols and deep network, user and application data, without compromising the efficiency of your virtual environment.

### User Tracking and Problem Solving

Our Connector ID technology enables each virtualized desktop with "caller ID" capabilities that gives an irrefutable, scalable and efficient means to gather detailed information on user access to and from virtual desktops and individual applications, and allows you to easily identify the users who are experiencing or contributing to issues such as unexplained system slowdowns.

### Virtual Application Compatibility

With Stratusphere you gain full visibility into individual user and application activity on any virtualization platform. Stratusphere lets you assess application activity, and profile all application resource footprints including CPU, memory, network bandwidth and SAN.

### ART/NRT and Interdependency Maps

Using Stratusphere, you gain visibility to application and network response times (ART/NRT) throughout the day. Additionally, you can map application dependencies and gather configuration and usage data from the desktop all the way down to the SAN.

### Track User Activity

Assess service level and other policies for individual users or user groups fully integrated with your user AD or LDAP infrastructure. Track end user activity for applications, physical and virtual desktops using Connector ID. Associate users and activity with their OS login ID. Track machine logons, application activity, network activity, performance, reliability and resource consumption by user or user group.
